Rodin Workshop, July, 2009

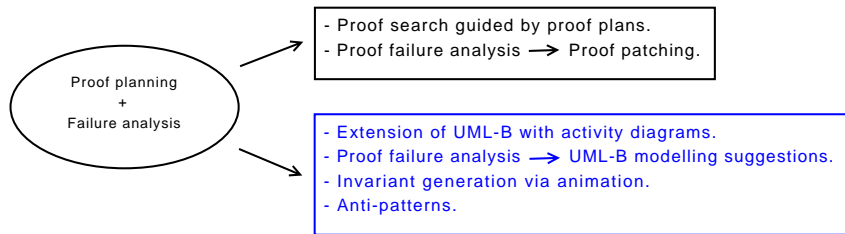

# Currently

# Our objective

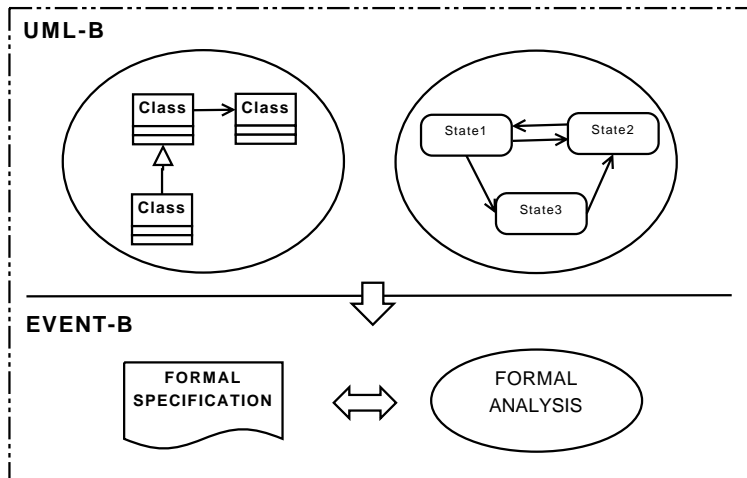

# Specific objectives

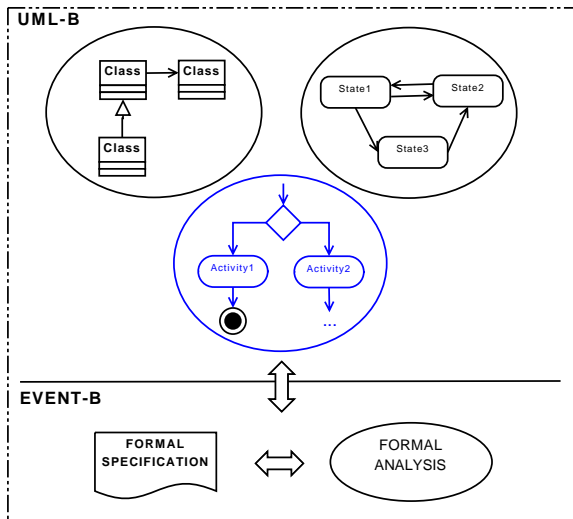

# UML-B extension proposal

# Extending UML-B

# Extending UML-B with activity diagrams

# Activity diagram

# Why activity diagrams?

- ▶ Allow the representation of the flow of actions and the interactions between the elements of a system.
- ▶ Contain more detailed information about the behaviour of the system.
- ▶ It is possible the modelling of concurrent behaviour.
- ▶ Modelling suggestions in the form of activity diagrams.
- ▶ Anti-patterns have already been analysed with activity diagrams in UML. <sup>1</sup>

# Analysis of anti-patterns in UML-B

# Anti-patterns

Anti-patterns are design patterns whose purpose is to document common bad practices in software design and to suggest solutions to improve them.

Anti-patterns are not mistakes! they are models that produce bad consequences like:

- ▶ Slower execution times.
- ▶ Unnecessary consumption of resources
- ▶ Violation of good design principles.

**Our purpose:** To identify anti-patterns by reasoning about UML-B designs.

# Advantages of analysing anti-patterns in UML-B

- ▶ It is possible to identify ineffective or potentially harmful models.
- ▶ They suggest a refactored suitable solution for the problem.
- ▶ Having a catalogue of UML-B anti-patterns would equip UML-B users with knowledge about patterns of models they should avoid.
- ▶ Anti-patterns can be analysed in the design stage.

# Modelling suggestions through proof failure analysis

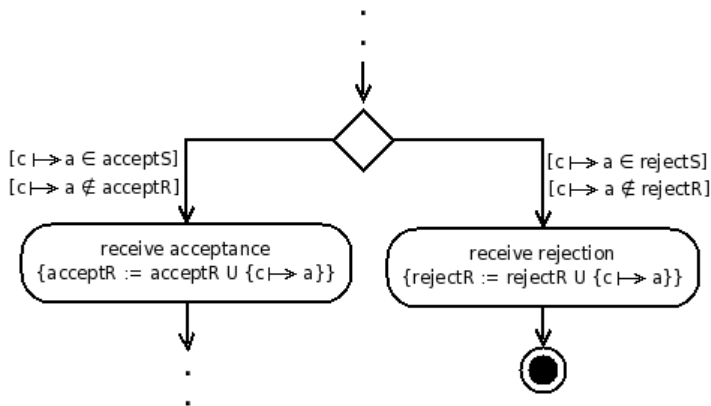

# Proof failure analysis

- ▶ Analysis of failed proof obligations.
- ▶ Generation of modelling suggestions.
- ▶ Modelling suggestions translated into UML-B diagrams.
- ▶ Feedback to the user given in the form of UML-B designs rather than in the form of failed proof obligations or Event-B code.

## Example: The contract net protocol

- ▶ Protocol of distributed negotiation process.
- ▶ An agent (the initiator) needs to find an agent or groups of agents (participants) to be in charge of completing a task.
- ▶ The initiator calls for proposals from the participants.
- ▶ The best proposals are chosen.
- ▶ The participants are informed about their rejection or acceptance.
- ▶ The protocol finishes when the task is completed by the participants.

## Acceptance and rejection of messages *buggy* model

# Translation to Event-B

**Event** *receiveAcceptance*  $\hat{=}$

**Any**  $c, a$  **Where**

$c \mapsto a \in \text{acceptS}$

$c \mapsto a \notin \text{acceptR}$

**Then**

$\text{acceptR} := \text{acceptR} \cup \{c \mapsto a\}$

**End**

**Event** *receiveRejection*  $\hat{=}$

**Any**  $c, a$  **Where**

$c \mapsto a \in \text{rejectS}$

$c \mapsto a \notin \text{rejectR}$

**Then**

$\text{rejectR} := \text{rejectR} \cup \{c \mapsto a\}$

**End**

# Proof obligations

**Invariant:**  $\text{acceptR} \cap \text{rejectR} = \emptyset$ .

Proof obligations	
<b>Hypothesis</b> $\text{acceptR} \cap \text{rejectR} = \emptyset$ $c \mapsto a \in \text{acceptS}$ $c \mapsto a \notin \text{acceptR}$	<b>Hypothesis</b> $\text{acceptR} \cap \text{rejectR} = \emptyset$ $c \mapsto a \in \text{rejectS}$ $c \mapsto a \notin \text{rejectR}$
<b>Goal</b> $(\text{acceptR} \cup c \mapsto a) \cap \text{rejectR} = \emptyset$	<b>Goal</b> $\text{acceptR} \cap (\text{rejectR} \cup c \mapsto a) = \emptyset$

# Reasoned modelling

$$\text{acceptR} \cap \text{rejectR} = \emptyset$$

$$c \mapsto a \in \text{acceptS}$$

$$c \mapsto a \notin \text{acceptR}$$

$\Rightarrow$

$$(\text{acceptR} \cup c \mapsto a) \cap \text{rejectR} = \emptyset$$

## CASE SPLIT

$$\text{acceptR} \cap \text{rejectR} = \emptyset$$

$$c \mapsto a \in \text{acceptS}$$

$$c \mapsto a \notin \text{acceptR}$$

$$c \mapsto a \notin \text{rejectR}$$

$\Rightarrow$

$$(\text{acceptR} \cup c \mapsto a) \cap \text{rejectR} = \emptyset$$

$$\text{acceptR} \cap \text{rejectR} = \emptyset$$

$$c \mapsto a \in \text{acceptS}$$

$$c \mapsto a \notin \text{acceptR}$$

$$c \mapsto a \in \text{rejectR}$$

$\Rightarrow$

$$(\text{acceptR} \cup c \mapsto a) \cap \text{rejectR} = \emptyset$$

However if we prove the negation of the goal:

$$\text{acceptR} \cap \text{rejectR} = \emptyset$$

$$c \mapsto a \in \text{acceptS}$$

$$c \mapsto a \notin \text{acceptR}$$

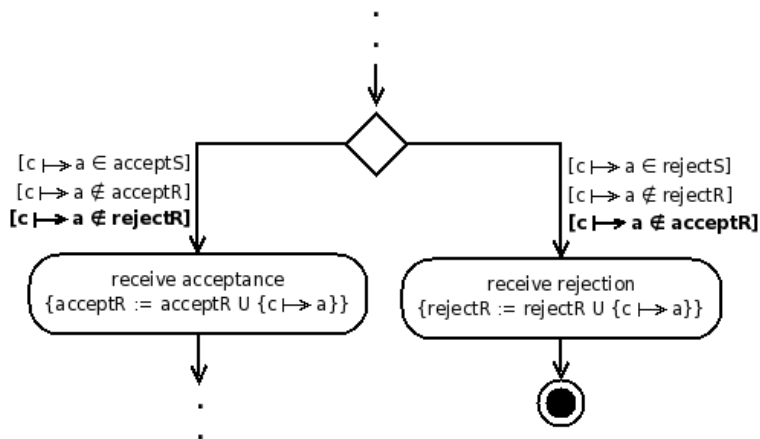

$$c \mapsto a \in \text{rejectR}$$

$\Rightarrow$

$$(\text{acceptR} \cup c \mapsto a) \cap \text{rejectR} \neq \emptyset$$

## Feedback to the user

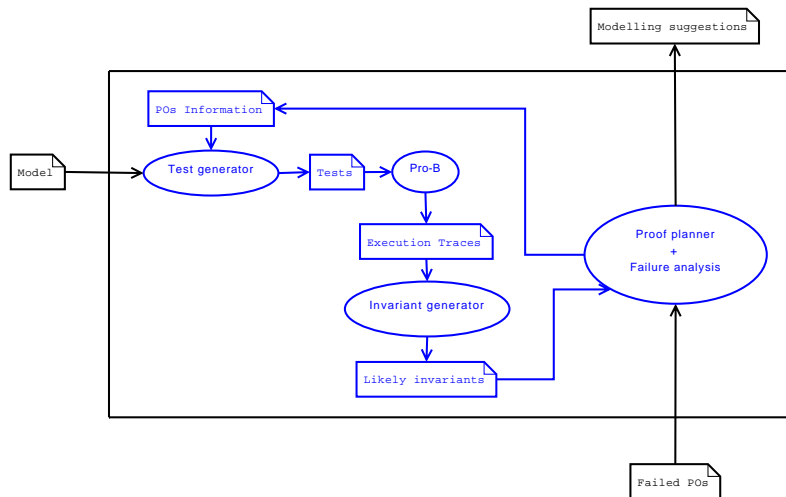

# Automatic invariant generation

# Invariant generation via animation

We are currently studying *Daikon* as a possible invariant generator to integrate with Rodin.

# Invariant generator integrated with Rodin

# Summary

Our main purpose is to help UML-B users by suggesting changes to their models through:

- ▶ Proof failure analysis.
- ▶ Automatic invariant generation.
- ▶ Analysis of anti-patterns.
